

HealthApp

Digital product summary

Description

HealthApp created by iDevBand holding helps healthcare providers to deliver a superior patient experience to increase their **revenue**. Our solutions can be integrated by any health provider such as hospitals, clinics, private healthcare providers, insurance companies etc. HealthApp is white label product, which can be quickly integrated and delivered to patients. Our solutions include mobile applications (Android, iOS) and CRM system. The most important features of our product are described below.

All in one

Keeping patients and their family's medical data in one place

Our solutions allow patients to have a clear overview about their and their family's medical data. Application collects medical data from all kind of specialists into one place. All data is up to date.

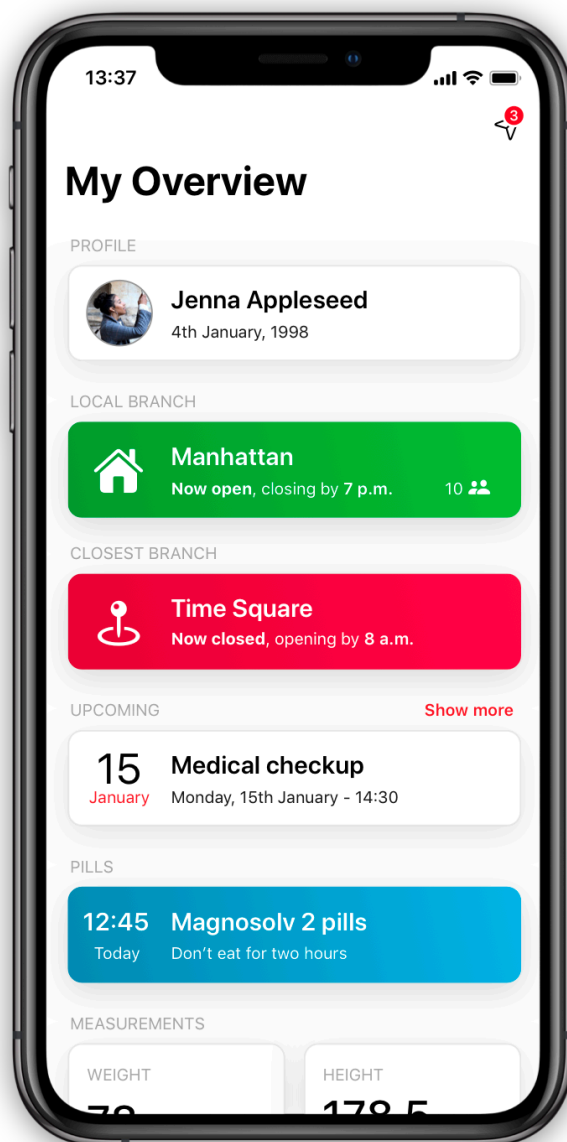

Above you can see "Dashboard" presenting the most important data for patients. That means patient's upcoming appointments, tablets to take, latest tests, information about your branch and personal information.

Application notifies patients about all listed events above (tablets, upcoming appointments, vaccinations etc.), even when the application is turned off or offline.

Also patients can see new messages from their doctor/hospital. A doctor or nurse can message patient(s) directly and this will improve patient experience.

All patients can be connected with their family members (wife/husband and children) on one application. That allows patients to have an overview about their family members and their health status.

Chronically ill patients have the latest measurements on the **Dashboard**. Application is able to collect data from electronic health devices and use them.

Integration

Our solution can be easily integrated with any EMR system

Integration of systems is one of the biggest issues in health digitalisation. Today more than ten thousand electronic medical record (EMR) providers exist worldwide. So it's impossible to provide solutions that would be ready for all EMRs.

Thanks to our experience with many EMR system providers we are able to design and develop solutions which are quick and easy to integrate with any EMR system.

Patients have their health data in their pockets. When patients are visiting specialists who have EMR systems, that are not integrated into the ecosystem of the patient's primary healthcare provider, they can easily find the necessary information within the HealthApp.

Patients can take a photo of medical reports and attach them into an appointment schedule or send to their practitioner. Patients can share all resources with other doctors/hospitals.

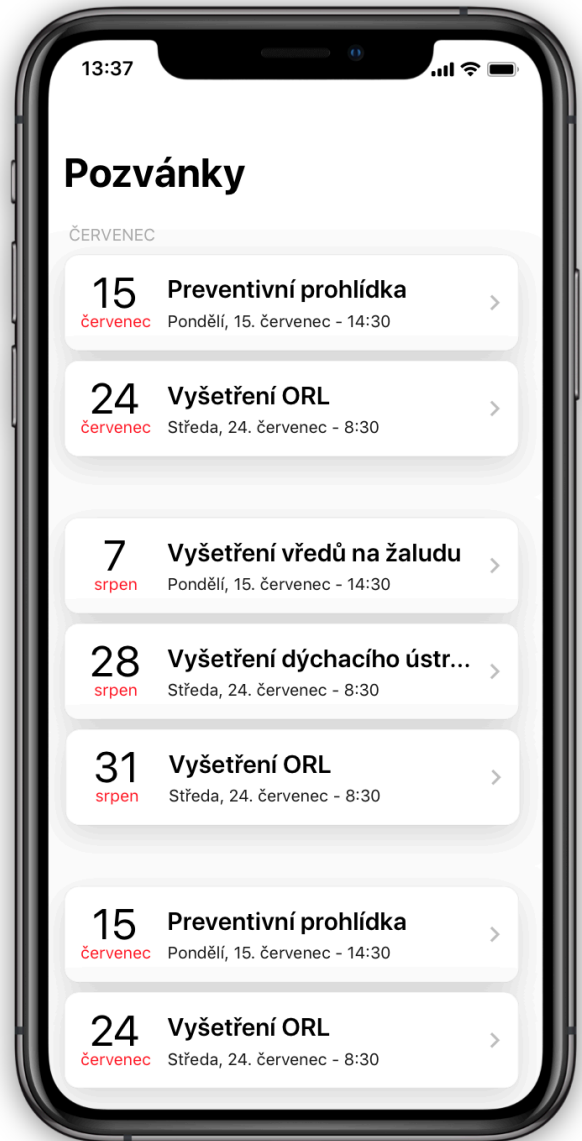

Most patients have no idea about results from their previous health examinations. Our application keeps patient's results and conclusions in one place and lets patients use them in future.

Appointments

Easily organise patient's appointments

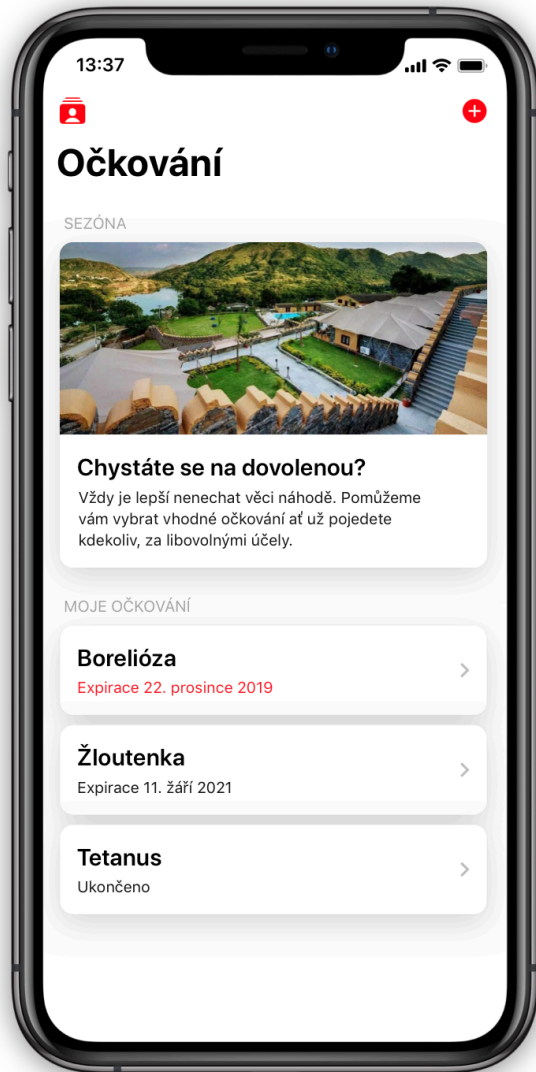

One of the most important features related to appointments is to have them all in one place with the possibility to **organise** them. Patients generally don't want to **waste time** in waiting rooms.

Patients are notified by the application about upcoming appointments and are able to see them in calendars.

Vaccination

Educate and motivate patients to vaccinate themselves

Sadly, there are a few conspiracy theories about **vaccinations**. Patients are not well educated in this area and very often they are under the influence of the conspiracy. This causes a lot of patients to avoid **vaccination** and risk their health. Our application helps educate patients about **vaccination** and motivate them to vaccinate themselves and their family members to minimise risk.

Our application messages patients directly about their expiration, re-vaccination and keeps them up to date about their **vaccination** status.

Our solution generates a vaccination card for patients. Patients are able to generate confirmation about each **vaccination**.

Thanks to increasing vaccination you can maximise patient prevention and **increase your revenue**.

Our system has sophisticated algorithms for **recommendation of vaccination** to patients based on gender, age, country, job, travel plans, health condition and family history.

Chronic illness

Collecting patients health data continuously

Continuous **monitoring** of patients with specific chronic diseases is crucial to emphasise proactive treatment. Continuous assessment of the health of these patients has the advantage of a timely change of treatment in case of imminent worsening of the health condition.

Patients can **monitor** actual results and how results change in time. In other words the patients have a clear overview about their regular tests and results.

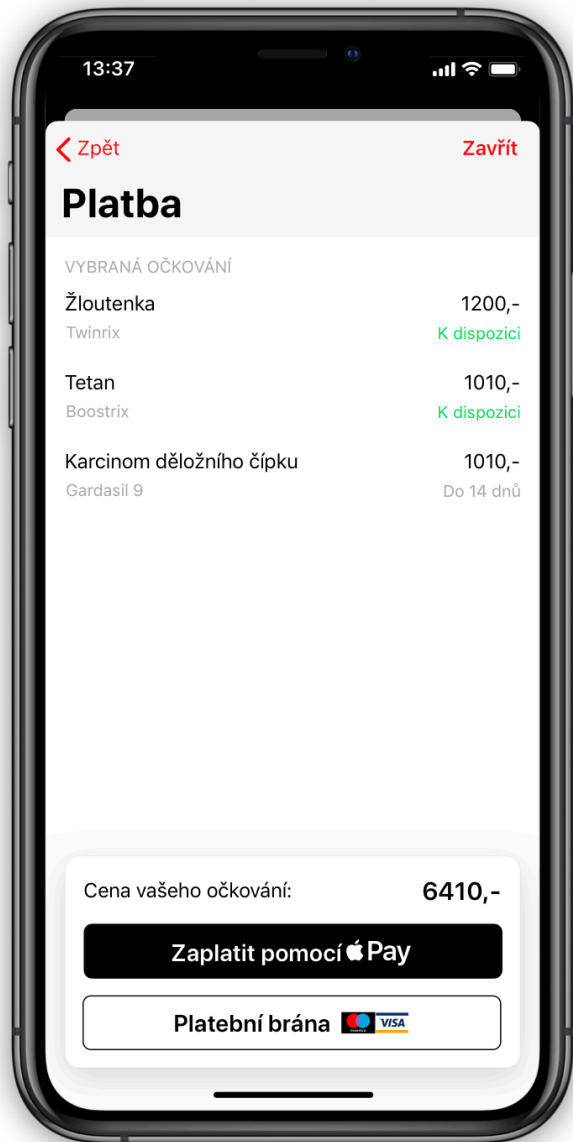

Also patients can **share their regular tests and results** with other doctors/hospitals. It makes cooperation between each doctor/hospital easier.

Our application educates patients about their diseases and motivates them to **not underestimate** their condition. Owing to this patients could avoid bigger problems in future.

Our solutions can collect and **monitor** data from electronic health equipment and utilise them. So patients with chronic diseases don't have to visit doctor/hospital for each test. You on the other hand have more dense data about the patient's health condition and can make better decisions in their treatment.

Online payments

Make payments more comfortable

Your branded app can contain an **online payment module**. Online payment can be provided using bank gateway, 3rd party solution (PayPal) or native way (Apple Pay/Google Pay).

Inclusion of online payment module elevates the patient's experience and you avoid all problems and complications that are related to cash payment.

Using the newest API's we are able to check patient's deductibles, estimate costs and compare medical options.

Measuring efficiency

Improving efficiency to increase revenue

There are few ways how to measure **efficiency**. We have integrated all of them to improve efficiency and patient experience.

Our great experience with beacon provider and developer (HW company with more than 20 years experience on the market) allows to to make efficient solutions.

As a healthcare provider you can measure the **efficiency** of each appointment. You can measure time spent in waiting room. That way you can compare branches, hospitals, doctors, nurses together.

You can detect when patient is coming, is in the waiting room, is leaving and react to those events based on your requirements. Thanks to that feature you can **call patients to action** (e.g. questionnaire, feedback, rating).

Make daily, weekly, monthly **bulletins, reports** to all kind of managers to keep them informed and in the picture how their staff and processes work.

Early detection of worsening working conditions. This allows you to avoid undesirable behaviour of your health personnel in the future and **save unexpected costs**.

Conclusion

Why choose us

Deep knowledge and experience in health industry allows us to find opportunities for any healthcare provider, how to increase **patient experience** and **healthcare provider revenue**.

We focus to increase **patient experience** and **healthcare provider revenue**, because we believe that these two approaches are connected.

Our solutions are constructed to be able to engage new acquisition and ultimately increase **healthcare provider revenue**.

We motivate people for prevention, vaccination, regular examination to avoid real problems and **save therapy costs**.

Perfect overview about your health staff and their **efficiency**. You can get feedback from questionnaires, ratings, statistics very easily and make conclusions.

Because our solutions include **early detection** of your health personnel you can avoid undesirable behaviour and **save unexpected costs**.
